The present invention describes a nucleic acid construct. The nucleic acid construct comprises: (a) a first polynucleotide segment including at least one nucleic acid sequence element; and (b) a second polynucleotide segment encoding a polypeptide including a nucleic acid binding domain being capable of specifically binding the above nucleic acid sequence element, and a localisation signal for directing transport of the polypeptide into a DNA containing organelle such that when the nucleic acid construct is introduced into a cell, expression of the polypeptide from the second polynucleotide segment directs transport of the nucleic acid construct into the DNA containing organelle. The nucleic acid construct is useful in high efficiency delivery of polynucleotides into DNA containing organelles such as nucleus, chloroplast or mitochondria, and containing organelles such as nucleus, chloroplast or mitochondria, and so can enhance any DNA transformation approach, including DNA vaccination approaches designed for therapeutic purposes. The nucleic acid sequence may also be used to isolate novel genes encoding nucleic acid sequence. ig proteins. The present sequence represents a peptide nucleic acid recognition sequence, which is used in an example from the present invention binding

Gossypium hirsutum.

fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular isolated nucleic acid molecule that encodes a plant protein or its tags to map genes

Claim 1; SEQ ID NO 15706; 34pp; English

The invention relates to 17880 cotton expressed sequence tags (ESTS; ACN45220-ACN63099). The ESTS were isolated from cDNA libraries generated from parimed or non-primed seeds from variety DESOB, mature seeds from variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carpel walls and septe from variety Nucotton33B. The invention also relates to substantially purified proteins or their fragments encoded by nucleic acid molecules of the invention, and to transformed plants having a nucleic acid construct comprising a nucleic acid of the invention. The cotton ESTs are useful as molecular tags to isolate genetic regions, to isolate genes to mapers, to determine gene function and to determining whether genes are useful for isolate genetic regions, to isolate genes are members of a particular gene family. The nucleic acid molecules may be used for isolated genes are associated with plant growth, quality, yield, and could also serve as links in metabolic and catabolic pathways. The nucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination or that may be used to mitigate stresses encountered during seed germination. The ESTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically significant genes in these tissues and/or other tissues.

New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular tags to map genes.

Claim 1; SEQ ID NO 14335; 34pp; English.

The invention relates to 17880 cotton expressed sequence tags (ESTB;
ACM45220-ACM63099). The ESTB were isolated from cDNA libraries generated
CC from primed seeds from variety DPSOB, mature seeds from
variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
tissue, developing fibree, carpel walls and septa from variety
CC from primed seeds from variety broteins or their fragments encoded by nucleic acid molecules of the
invention, and to transformed plants having a nucleic acid construct
comprising a nucleic acid of the invention. The cotton ESTB are useful as
molecular tags to isolate genetic regions, to isolate genes to members of a particular gene function and to determining whether genes are
members of a particular gene family. The nucleic acid molecules may be
cused for isolating a variety of agronomically significant genes
associated with plant growth, quality, yield, and could also serve as
links in metabolic and catabolic pathways. The nucleic acid molecules are
also useful for identifying genes important in initiating and maintaining
seed germination or that may be used to mitigate stresses encountered
during seed germination. The ESTS additionally enable the acquisition of
promoters and cis-regulatory elements which will be useful to express
comprises genetic and molecular mapping, and in cloning of agronomically
schemes, genetic and molecular mapping, and in cloning of agronomically
contents and elso permits the acquisition of molecules are further useful for
detecting the expression level or pattern of a protein or mRNA and for
detecting the presence or quantity of a protein by tissue printing. The cotton variety Nucotton33B gynoecium tissue cDNA library (LIB3829). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the US patent office at segdata.uspto.gov/sequence.html?DocID=US20040123340

used for isolating a variety of agronomically significant genes
associated with plant growth, quality, yield, and could also serve as
links in metabolic and catabolic pathways. The nucleic acid molecules
also useful for identifying genes important in initiating and maintaining
seed germination or that may be used to mitigate stresses encountered
during seed germination. The ESTs additionally enable the acquisition of
promocers and cis-regulatory elements which will be useful to express
gronomically significant genes in these tissues and/or other tissues,
and also permits the acquisition of molecular markers useful in breeding
schemes, genetic and molecular mapping, and in cloning of agronomically
significant genes. The nucleic acid molecules are further useful for
detecting the expression level or pattern of a protein or mRNA and for
detecting the presence or quantity of a protein by tissue printing. The
present sequence represents a specifically claimed EST isolated from a
cotton variety pps08 primed seed cDNA library (LIB3825). The sequence
data for this patent did not form part of the printed specification, but
was obtained in electronic format directly from the US patent office at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          seqdata.uspto.gov/sequence.html?DocID=US20040123340

Ziegler TE;

New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular

Claim 1; SEQ ID NO 14338; 34pp; English.

The invention relates to 17880 cotton expressed sequence tags (ESTE; ACN45220-ACN63099). The ESTE were isolated from cDNA libraries generated from primed or non-primed seeds from variety DPSOB, mature seeds from variety coker 312 Boswell 96 Field, and androecium tissue, gynoecium variety coker 312 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carpel walls and septa from variety coker 10 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carpel walls and septa from variety concretising a nucleic acid of the invention. The cotton ESTS are useful as molecular case function and to determining whether genes are comprishing a nucleic acid of the invention. The cotton ESTS are useful as molecular tags to isolate genetic regions, to isolate genes are molecular gene family. The nucleic acid molecules may be used for isolating a variety of agronomically significant genes are useful as molecular and catabolic pathways. The nucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination. The ESTS additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express agronomically significant genes in these tissues and/or other tissues.

CC during seed germination. The ESTS additionally enable the acquisition of promoters and cis-regulatory elements which will be useful for chemes, genetic and molecular mapping, and in cloning of agronomically significant genes. The nucleic acid molecules are further useful for detecting the expression level or pattern of a protein or maker of present sequence represents a specifically claimed EST isolated from a cotton variety Mucronarially element distormed and molecular mapping, and in cloning of agronomically sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the brinted EST specification, but was obtained in electronic format directly from the equence to sequence in the prese

Claim 1; SEQ ID NO 14266; 34pp; English.

number of oligonucleotides derived from an orthologue gene of a different outputs or species immobilised on a support body. The oligonucleotide array has two sides comprising a gene derived from two different corganism or species immobilised on a support body. The oligonucleotide array has two sides comprising a gene derived from two different corganisms, in which one side comprises a human gene. In the oligonucleotide array a base sequence differs in a different position on the support body. Each of the oligonucleotides is a partial sequence of the organism species A and the organism species B is less than corganism species A and the organism species B is the level-of. The sequence homology of the genes other than the orthologue gene of the organism species A and the organism species B is the level-of. The organism species B and the organism species B is the level-of. The organism species B and the organism species B is the level-of. The organism species B and the organism species B is the level-of. The organism species B and the organism species B is the melting. The found value or the calculated value of the melting.

The oligonucleotide array is useful for measuring expression distribution of the orthologue gene in different organisms. The method is useful for comparing expression change of the orthologue gene in different organisms. The method is useful for medical agent administration and for comparing change of the function of the orthologue gene in different organisms. The oligonucleotide array has the orthologue gene in different organisms. The oligonucleotide array has two or more types of organism simultaneously. The oligonucleotide array is unproves reliability of measurement. This polynucleotide sequence represents a probe of a rat gene for comparison against a human gene used in the oligonucleotide array of the invention.

New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of genome, useful for detecting tissue-, pathology-, and developmentalspecific genes.

Example 1; SEQ ID NO 10766; 47pp; English

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcribtome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or cannering the corresponding transcriptom, and in detecting RNA transcripts may also be used as specialised mini transcriptomes. The libraries may also be used as specialised mini there is to detect transcriptome under a particular biological or pathological state, and so allowing the detection of tissue continuous precific pathological condition; to detect or apathology-specific genes such as those genes only expressed in specific genes; and to detect RNA transcriptome of a patient suffering from a particular disorder. ABN27253 to ABN59589 represent oligonucleotide sequences from the parinted specification, but was obtained in electronic format carethy from WIPO at ftp. wipo.int/pub/published_pct_sequences

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                               6269

//note="Vector: pBluescript SK-; Site_1: EcoR1; Site_2:
Xhof; supplier: Petunia x hybrida cv. mitchell Diploid
plants were grown from seeds to a fully flowering stage
under standard greenhouse conditions. Ten entire flowers
of six developmental stages were collected on the same day
from plants grown in standard greenhouses. The flower
stages were as follows in chronological order from
youngest to oldest: stage 1 - no color in corolla;
o.5 inches long stage 2 - first sign of color in corolla;
corolla (not open); corolla 1.5 inches long stage 4 -
fully open corolla; anthers not yet dehisced stage 5 -
fully open corolla; freshly anthesed, bright yellowing of
corolla tube; dry brown pollen (if present); stigma dry.
Total RNA was extracted from each sample, and 100
micrograms of each sample was combined for subsequent poly
A+ mRNA selection and cDNA synthesis."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CO912202 90 bp mRNA linear EST 16-AUG-2004
